[1.2] FIGURE 3: ASSET PRICES
```

Parameters for the left panel:
 given_beta = 0.9894,
 given_alpha_b = 0.1,
 given_alpha_c = 0.65,
 given_c_ub = 0.15,
 given_c_lb = 0.0001,
 given_s = 0.54,
 given_eta = 0.7,
 given_chi = 0.07,
 given_B = 0.0098,
 given_i = 0.01,
 eta_grid = [0.2,0.7,0.8,0.99]

Parameters for the right panel:
 given_beta = 0.99,
 given_alpha_b = 0.1,
 given_alpha_c = 0.65,
 given_c_ub = 0.19,
 given_c_lb = 0.0001,
 given_s = 0.54,
 given_eta = 0.7,
 given_chi = 0.07,
 given_B = 0.0098,
 given_i = 0.01,
 eta_grid = [0.4,0.7,0.8,0.99]

```
*****  
[1.3] FIGURE 4: WELFARE COMPARISON
```

Parameters for the left panel:
 given_beta = 0.9894,
 given_alpha_b = 0.1,
 given_alpha_c = 0.65,
 given_c_ub = 0.15,
 given_c_lb = 0.0001,
 given_s = 0.54,

```
given_chi = 0.07,  
given_B = 0.0098,  
given_i = 0.01,  
eta_grid = [0.2,0.7,0.8,0.99]
```

Parameters for the right panel:

```
given_beta = 0.99,  
given_alpha_b = 0.1,  
given_alpha_c = 0.65,  
given_c_ub = 0.19,  
given_c_lb = 0.0001,  
given_s = 0.54,  
given_chi = 0.07,  
given_B = 0.0098,  
given_i = 0.01,  
eta_grid = [0.4,0.7,0.8,0.99]

[3.1] FILES AND REQUIREMENTS

Requirements:
Anaconda Jupyter

Files:
Online_Appendix_General_Preference.ipynb

```
*****
```

[3.2] FIGURE 8: EXAMPLE OF MULTIPLE EQUILIBRIA

Parameters:
beta=0.99
alpha=0.05
rho=0.5
gamma_h=10
gamma_l=-10
s_h=0.55
eta=0.01
zeta=0.01

Define utility function as:
def utility(q):
return 2*q**0.5

```
*****
```

[3.3] FIGURE 9 RIGHT PANEL: ASSET PRICES AS GAMMA^L AND GAMMA^H SCALED BY A FACTOR KAPPA

Parameters:
beta=0.99
alpha=0.02
rho=0.5
gamma_h=10
gamma_l=-10
s_h=0.55
eta=0.99
zeta=0.007

Define utility function as:
def utility(q):
return 2*q**0.5

```
*****
```

[3.4] FIGURE 9 LEFT PANEL: EXAMPLE OF NON-MONOTONE LAMBDA

Parameters of the left panel:

```

given_beta=0.958,
given_alpha=0.005,
given_rho=1,
given_gamma_h=1.444262,
given_gamma_l= -1.236,
given_s_h=0.6,
given_s_l=0.4,
given_zeta=0.01,

```

Define utility function of the left panel as:

```

C = 120
def utility(q):
    return 1-np.exp(-C*q)

def utility_prime(q):
    return C*np.exp(-C*q)

def utility_doubleprime(q):
    return -C*C*np.exp(-C*q)

```

[3.5] FIGURE 10: NUMERICAL EXAMPLES OF AN INCREASE IN η

Parameters of the left panel:

```

given_beta=0.99,
given_alpha=0.01,
given_rho=0.5,
given_gamma_h=10,
given_gamma_l= -10,
given_s_h=0.55,
given_s_l=0.45,
given_zeta=0.005,

```

```

eta_grid = [0.1,0.99]

```

Define utility function of the left panel as:

```

def utility(q):
    return 2*q**0.5
def utility_prime(q):
    return q**(-0.5)
def utility_doubleprime(q):
    return -0.5*q**(-1.5)

```

Parameters of the right panel:

```

given_beta=0.96,
given_alpha=0.3,
given_rho=1,
given_gamma_h=13,
given_gamma_l= -12,
given_s_h=0.68,
given_s_l=0.32,
given_zeta=0.01,

```

```

eta_grid = [0.15,0.95]

```

Define utility function of the right panel as:

```
D = 1
def utility(q):
    return 2*np.log(q+D)

def utility_prime(q):
    return 2/(q+D)

def utility_doubleprime(q):
    return -2/(q+D)**2
```

[3.6] FIGURE 5: THREE EXAMPLES OF b_{ji}

Parameters:

```
given_beta=0.958,
given_alpha=0.005,
given_rho=1,
given_gamma_h=1.444262,
given_gamma_l= -1.236,
given_s_h=0.6,
given_s_l=0.4,
given_zeta=0.01,
```

```
eta_grid = [0.1,0.9]
```

Define utility function as:

```
C = 120
def utility(q):
    return 1-np.exp(-C*q)

def utility_prime(q):
    return C*np.exp(-C*q)

def utility_doubleprime(q):
    return -C*C*np.exp(-C*q)
```

Change $j = 4, 9,$ and 15 to simulate $\pi_j = 0.1, 0.46,$ and 0.91 respectively.

[3.7] FIGURE 11: TWO EXAMPLES OF A CHANGE IN η

Parameters for the blue lines:

```
given_beta=0.9,
given_alpha=0.6,
given_rho=1,
given_gamma_h=14,
given_gamma_l= -6,
given_s_h=0.6,
given_s_l=0.4,
given_zeta=0.01,
```

```
eta_grid = [0.01,0.9]
```

Utility function for the blue lines:

```
A_u = 2
B_u = 1.9
lambda_u = 0.6
a_u = 2.2
b_u = 2
theta_u = 10
def utility(q):
    return lambda_u*B_u*q + (1-lambda_u)*A_u*(theta_u -
np.exp(-b_u*q**a_u))

def utility_prime(q):
    return lambda_u*B_u + (1-lambda_u)*A_u*np.exp(-
b_u*q**a_u)*b_u*a_u*q**(a_u-1)

def utility_doubleprime(q):
    return (-b_u*a_u*(q**(a_u-1))*(1-lambda_u)*A_u*np.exp(-
b_u*q**a_u)*b_u*a_u*q**(a_u-1)
+ (1-lambda_u)*A_u*np.exp(-
b_u*q**a_u)*b_u*a_u*(a_u-1)*q**(a_u-2) )
```

Parameters for the red lines:

```
given_beta=0.9,
given_alpha=0.6,
given_rho=1,
given_gamma_h=9,
given_gamma_l= -6,
given_s_h=0.6,
given_s_l=0.4,
given_zeta=0.01,
```

```
eta_grid = [0.01,0.9]
```

Utility function for the red lines:

```
A_u = 1.18
rho_u = 0.01
def utility(q):
    if q == 0:
        return A_u*0.001**(1-rho_u)/(1-rho_u)
    else:
        return A_u*q**(1-rho_u)/(1-rho_u)
def utility_prime(q):
    if q == 0:
        return A_u*0.001**(-rho_u)
    else:
        return A_u*q**(-rho_u)
def utility_doubleprime(q):
    if q == 0:
        return A_u*(-rho_u)*0.001**(-rho_u-1)
    else:
        return A_u*(-rho_u)*q**(-rho_u-1)
```

[3.8] FIGURE 12: ASSET PRICES IN A DUAL-ASSET ECONOMY

Parameters for the left panel:

```
beta=0.99
alpha=0.05
rho=0.5
gamma_h = 10
gamma_l = -10
gamma_s=0.0001
sigma=0.5
s_h=0.55
eta=0.5
zeta=0.01
```

Define utility function of the left panel:

```
def utility(q):
    return 2*q**0.5
```

Parameters for the right panel:

```
beta=0.99
alpha=0.05
rho=0.5
gamma_h = 10
gamma_l = -10
gamma_s=0.0001
sigma=0.5
s_h=0.55
eta=0.5
zeta=0.0007
```

```
kappa= 0.009
```

Define utility function of the right panel:

```
def utility(q):
    return 2*q**0.5
```

[3.9] FIGURE 13: NON-MONOTONE tau AND WELFARE Omega

Parameters:

```
beta=0.99
alpha=0.05
rho=0.5
gamma_h = 10
gamma_l = -10
gamma_s=0.0001
sigma=0.5
s_h=0.55
eta=0.5
zeta=0.0007
```

Define utility function:

```
def utility(q):  
    return 2*q**0.5
```

[3.10] FIGURE 14: BELIEFS OF REGULAR BUYERS AND HODLERS
AND FIGURE 15: ASSET PRICES AND HOLDING WITH HODLERS

Parameters:

```
beta=0.99  
alpha=0.01  
rho=0.5  
gamma_h = 10  
gamma_l = -10  
sigma=0.5  
s_h=0.55  
eta=0.5  
zeta=0.01  
x=12
```

Define utility function as:

```
def utility(q):  
    return 2*q**0.5
```

Additional parameter used in the right panel:

```
kappa_grid = [0.001,0.5]
```
